

Liquid Flattening Agent

Product Number:

#950-4 Quart

SPI Liquid Flattening Agent Qualities:

SPI Flattening Agent is a high strength gel type product that utilizes the finest raw flattening agent available. This product is very high strength and stays in suspension as well though always pre-mix or pre-shake before adding.

Reducer Selection:

If you are using this Liquid Flattening Agent in a coating that requires reduction always use the next faster speed meaning if you would normally use an 85 degree reducer in this application use a 70-75 degree reducer instead.

Mixing:

Mix or Shake this product thoroughly before each use! Then, gradually add #950 Liquid Flattening Agent until the desired flatness is achieved and verified on a test spray-out panel. Normally 30-50% of activated material.

Spray a Test Panel First:

As with any flattener always spray a test panel first and allow to totally dry for full flattening effect because no 2 products are alike and everyone's idea of semi-gloss or flat differs! Plus, different coatings will require different amounts of flattener.

Common Mistakes:

1. Not allowing the first coat to properly flash before applying the 2nd coat
2. Spraying back to back wet coats
3. Using slow reducers and activators will also counteract.

All of these common mistakes will override the properties of the flattening agent!
